

MEDIENRÜCKGABE

MITWELTEN
Media-ecological Infrastructures for Biodiversity

WildCam TV
The media installation WildCam TV was developed as part of the interdisciplinary design research project MITWELTEN (mitwelten.org). It presents animated image series that were recorded with wildlife cameras on the HDK campus or in the Reichenacher Höhe (municipality of Reinach BL) in the years 2020-2023. WildCam TV makes it possible to create different, flipbook-like image sequences based on individual still images. The installation offers a parametric selection criteria for this: location, time, day (night), interval and frame rate. Instead of rendering a video, the image sequence generator allows the database and the selected still images are sequenced. As the image sequence generator allows the database to be searched for situations of interest, it is also a valuable medium for biological studies.

Please press "open interface" to open the menu (left upper corner) for interaction.
Thank you for your interest!
